

An optional upgrade to Gentex's HGU-56/P (as shown above) or HGU-84/P helmets, the MaxilloFacial Shield (MFS) by Gentex safeguards the lower face from rotor wash, flying debris and windblast during helicopter operations. The protective shield attaches to the helmet with a complete installation kit, and provides superb protection for the lower face and substantially improves voice communications by reducing wind noise across the microphone(s).

- HGU-56/P MFS: For the HGU-56/P, an upgrade kit contains the face shield, helmet side hardware, shield side hardware and instructions for installation. The MFS HGU-56/P version comes standard with dual side release latches that provide for positive lock and ambidextrous quick release of the shield. The MFS weighs less than five ounces, and offers an interface between shield and visor that reduces wind on the face. The shield offers ballistic fragmentation protection (17 grain FSP) up to 550 feet per second (fps). One size fits all HGU-56/P helmets.
- HGU-84/P MFS: For the HGU-84/P, an upgrade kit contains the face shield, helmet side and shield side hardware, and instructions for installation. The HGU-84/P MFS is attached to the helmet with adjustable straps and snaps. The MFS weighs less than five ounces, and offers an interface between shield and visor that reduces wind on the face. The shield offers ballistic fragmentation protection (17 grain FTP) up to 550 feet per second (fps). Two sizes are available Medium/Large and X Large/X Large Wide.
- Both Versions: The MFS is available in a subdued matte black finish that can be easily custom painted, and is compatible with Mike Lites™. Further, a standard wire boom microphone or flexible boom microphone secured to a HGU-56/P or HGU-84/P can be positioned behind the MFS, further enhancing communications clarity.
